What we know about Omicron

Here are some of the things that we do know about Omicron:

- It is more transmissible than previous variants, and it is estimated to be 2-4 times more likely to cause infection than the Delta variant.

- It has been shown to evade some of the protection provided by vaccines, but vaccinated people are still less likely to get sick, be hospitalized, or die from COVID-19.
- The most common symptoms of Omicron are similar to those of other variants of COVID-19, including fever, cough, fatigue, and muscle aches.
- Omicron is more likely to cause mild illness than previous variants, but it can still lead to serious illness, hospitalization, and death, particularly in people who are unvaccinated or who have underlying health conditions.

What we don't know about Omicron

There are still a lot of things that we don't know about Omicron, including:

- How long it will take for Omicron to become the dominant strain globally.
- How effective vaccines will be against Omicron, particularly in preventing severe illness and death.
- Whether Omicron will cause a more severe wave of illness than previous variants.
- How long the immunity provided by natural infection with Omicron will last.

What we can do to protect ourselves from Omicron

The best way to protect yourself from Omicron is to get vaccinated and boosted. Vaccines are still the most effective way to prevent serious illness,

hospitalization, and death from COVID-19. Other ways to protect yourself from Omicron include:

- Wearing a mask in public indoor settings
- Social distancing
- Frequent hand washing
- Staying home if you are sick

The future of Omicron

The future of Omicron is uncertain. However, we can take steps to protect ourselves and our loved ones, and we can stay informed about the latest information on this rapidly evolving situation.

For more information on Omicron, please visit the following resources:

- Centers for Disease Control and Prevention
- World Health Organization
- U.S. Food and Drug Administration
